

## Water Purification

There are 3 main processes undertaken in the water purifying process: Filtration Bacterial Oxidation Chlorine Treatment The different stages are listed in more detail below: Water pumped from river into a reservoir Water fed into sedimentation tank where solids settle Sand beds filter out smaller particles Chlorine added to water to kill germs Sulphur Dioxide then removes the chlorine Possibly, water is filtered through GAC (Granular Activated Carbon). This improves the taste and smell of the water Possibly, fluorides added to water Water is then pumped to its users
