Life Processes

Movement Animals move to find food and away from predators and plants move towards light. Reproduction Both animals and plants reproduce to keep their species in existence. Sensitivity Animals and plants are sensitive to their surroundings due to their sensory organs. Nutrition Animals need food for respiration and plants need minerals from the soil. Excretion Waste products must be excreted from plants and animals. Respiration Animals and plants must turn their food into energy by respiration. Growth Animals grow larger and stronger which helps them hunt better.
